Our challenge: Translation of our discoveries in basic research into practical medical applications Connecting the knowledge and methodology of basic science including immunology, molecular biology, cell biology, and developmental engineering with clinical medicine, we are working on uncovering new diseases, elucidating the causes of disease, and developing therapeutic modalities. The ability to differentiate, one of the two main characteristics of stem cells, varies between stem cells depending on their origin and their derivation fig. The generation of megakaryocytes for patient-specific platelet production from iPSCs will drive progress in this area.
